DETAILED ACTION

Specification

1. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

Claim Objections

2. Claims 5-11 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim 4. See MPEP § 608.01(n). Accordingly, the claims 5-11 not been further treated on the merits.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by Wong.

Wong discloses a method of enhancing a video bit stream using temporal scalability, wherein the peak signal-to-noise ratios of bidirectionally predicted pictures in an enhancement layer are determined with reference to the peak signal-to-noise ratios of pictures in another layer (Wong: column 6, lines 10-60), as in claim 1.

Wong discloses a method of enhancing a video bit stream using temporal scalability, wherein the number of bits allocated to encode a bidirectionally predicted picture of an enhancement is determined with reference to the number of bits used to encode a picture of another layer (Wong: column 7, lines 1-39), as in claim 2.

Wong discloses a method of enhancing a video bit stream using temporal scalability, wherein temporal positions of predicted picture in an enhancement layer are determined to be spaced evenly with reference to temporal positions of pictures in lower layers (Wong: column 6, lines 1-26), as in claim 3.

Regarding claim 4, Wong discloses a method of enhancing a video bit stream using temporal scalability, wherein temporal positions of predicted picture in an enhancement layer are determined to be spaced evenly with reference to temporal positions of pictures in lower layers (Wong: column 6, lines 1-26) and with reference to the number of bits used to encode a picture of another layer (Wong: column 7, lines 1-39), as in claim 4.
